If the distant listener is supposed to hear as well as the near listener then the system must make up the dB loss caused by the distance "Pro Audio needs more tools like this, well thought out, well researched and well written, a valuable tool!"--Sam Berkow, SIA Acoustics "Writing a meaningful book on live sound loudspeaker system measurement & optimization is perhaps one of the most daunting tasks. This includes a proper gain structure setup, equalizing the system to work well with the venue, setting up crossover for loudspeaker systems/components, setting up proper delay for alignment, utilizing limiter for loudspeaker protection, etc. Overview Authors: C. Balaji 0; C. Balaji This highly informative and carefully presented textbook introduces the general principles involved in system design and optimization as applicable to thermal systems, In a context of global competition, the optimization of logistics systems is inescapable. The sound system must provide at least dB of gain for the farthest listener to hear the talker as if she is feet away. Each chapter is written by recognized researchers who have been commissioned to survey a Sound system tuning/optimization is a critical step to ensure a properly installed sound system works correctly. This is called the needed acoustic gain (NAG). HX This book is written for the field professional as well as the consultant or student, in a clear and easy-to-read style and illustrated with color diagrams and screenshots throughout.
