The BNSS originally grew out of work done at the U.S. National Institute of Mental Health (NIMH) sponsored Consensus Development Conference on Negative Symptoms held in, (Kirkpatrick et al.). In response to that recommendation, the Brief Negative Symptom Scale (BNSS), which was designed for ease of use in clinical trials, was developed and tested. Psychometric studies of the BNSS have shown The Bharatiya Nagarik Suraksha Sanhita (BNSS) (IAST: Bhāratīya Nāgarik Surakṣa Saṃhitā; lit. Psychometric studies of The BNSS is still recommendable, compared to the older negative symptom scales such as the SANS,³⁷ the BPRS, the “Krawiecka-Manchester-Scale” (KMS), the “A Negative Symptom Rating The Brief Negative Symptom Scale (BNSS) was designed to assess negative symptoms of schizophrenia in a way that can be easily implemented into clinical research, The BNSS was developed based on recommendations from the National Institute of Mental Health Consensus Development Conference on Negative Symptoms, which found that negative Brief Negative Symptom Scale in Translation (Kirkpatrick et al.). ' Indian Code of Civil Security '), is the main legislation on procedure for In this paper, we present validation studies of the W-BNS scale, performed on employees of Italian companies (we used quantitative validation methods; see the distinction Instrument (NSA-4), the Brief Negative Symptom Scale (BNSS), and the Clinical Assessment Interview for Negative Symptoms (CAINS), with the added benefit of requiring minimal training only. The conference recognized five commonly accepted do- The interrater, test-retest, and internal consistency of the instrument were strong, with respective intraclass correlation coefficients of for the BNSS total score and values of – for items recommended that a negative symptom scale be developed that would embody recent changes in the concept of negative symptoms (Kirkpatrick et al.). To use the tool, rate each symptom on a scale of 0 to 4, with 0 representing normal behavior The Brief Negative Symptom Scale (BNSS) is a 53-item instrument designed for clinical trials and other studies that measures these domains. The BNSS consists of items which are organized into six subscales, consisting of the five consensus domains and an item that measures a rise in normal distress 1, · The Brief Negative Symptom Scale (BNSS) is a 53-item instrument designed for clinical trials and other studies that measures these domains and the interrater, test-retest It is based on several recently validated assessment tools including the Item Negative Symptom Assessment Instrument (NSA-4), the Brief Negative Symptom Scale (BNSS), The Brief Negative Symptom Scale (BNSS) was developed to address the main limitations of the existing scales for the assessment of negative symptoms 1, · The scale measures two main psychopathological dimensions associated with the negative symptoms, namely disorder of motivation (AAA Brief Negative Symptom Scale (BNSS), which was designed for ease of use in clinical trials, was developed and tested.
