This Standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize • Review new changes to NSF that impact how BSCs are used, installed, or require modification to stay current with today's safety and health expectations. This revision updates the instrumentation language. This revision adds definitions to clarify biosafety cabinet shell penetrations and cable ports with consideration given to service technicians and cabinet users relating to safety. This standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize NSF/ANSI Annex I (formerly Annex E) details biosafety cabinet selection, installation, use, lifespan and commissioning. Test and certify your Class II biosafety cabinetry to minimize the hazards of working with biosafety agents, levels NSF tests and certifies biosafety cabinetry to the standard NSF/ANSI STANDARD NSF position statement dated (see CETA CAG) Presented by James T. Provisions for mechanical and electrical safety have not been included in this Standard because governmental agencies or other national standards-setting organizations provide safety requirements The intent is to ensure that the challenge port is opened in negative pressure.
